User Stories

1. I (user) want to generate a tailored job application (cover letter & CV bullet points) based on my CV and job description, to apply more effectively to a chosen position.

Main Success Scenario

1. The user logs in and navigates to the **CV section**.
2. The user pastes their CV text and saves it as "**General CV**." (later attaches cv as a file)
3. The user navigates to the **Job section** and scrolls through the listed jobs from a **third party api.**
4. The system extracts **key details** (title, company, must-have skills, keywords).
5. The user goes to the **Generate section** and selects their CV and the job description.
6. The system sends the **data** to the **AI model**.
7. The system generates:
   a. A professional **cover letter** (200–300 words)
   b. 5–7 tailored CV **bullet points**
   c. (A keyword coverage percentage)
8. The user reviews the generated content, copies it, or saves it as a **draft**.
9. (The user can regenerate with a different tone (e.g., confident, concise) if needed.)
10. The user downloads or pastes the tailored application into their actual job application.

Alternative Scenarios

- **Invalid Job Description:** If the AI cannot parse the job description, the system asks the user to re-paste or shorten it.
- **Keyword Coverage Too Low:** The system highlights missing requirements and suggests improvements.
- **No CV Provided:** The system prompts the user to first add CV information.
